

eBMS/Video Door Entry

eBMS / Video Door Entry offers live audio, video and door entrance control either as a stand-alone system or as part of an integrated home automation solution.

The Video Door Entry application is embedded

within our eBMS/Mobile app for Android & Apple based devices, and is enabled by the addition of a simple, low cost license feature.

External entrance panels are also supported at multiple locations, from simple lower cost 1 - 4 button devices up to our fully programmable touch screen based system for 100s of apartments / users. Both are easy to configure and are extremely easy to use.

In addition the eBMS/Mobile app can also directly call any SIP enabled CCTV camera allowing operators to have live visibility of their buildings.

Integrating both video door entry and home automation functions together in the same app using Tridium Niagara as the host, makes eBMS/Mobile an extremely powerful and cost-effective home automation solution.

As with our Home Automation offering, the door entry system is fully integrated with the building and all it's intelligent systems by being based on the Tridium Niagara Framework. Not only does the framework offer a single cohesive integrated IoT platform but when used with Niagara Security, we can include access control and security monitoring of the entire home.
